

September 10, 2013, Update

Over the Labor Day weekend, the project team successfully installed a plate over the gate to stop water from draining from the reservoir.

Please note that while the water level should begin to rise over the next several months (with rainfall), work continues on a second separate project to repair the concrete slabs that carry the water downstream when the main spillway overflows. This project should take about 2 years and the water level will intentionally be kept about a foot and a half lower than normal to facilitate the work.

If you have any questions, please contact Waterworks' Public Information Office at 757-926-1155 or email [Lee Ann Hartmann](mailto:LeeAnn.Hartmann@waterworks.org), Waterworks' Public Information Specialist.
